

## SPECIFICATION AMENDMENTS

Please replace the paragraph n page 5, lines 14-19, with the following rewritten paragraph:

In addition, L<sup>1</sup> and L<sup>2</sup> are described herein as linkers. The nature of such linkers is less important than the distance they impart between the portions of the molecule. Typical linkers include alkylene, *i.e.* (CH<sub>2</sub>)<sub>n</sub> R, or alkenylene - *i.e.*, an alkylene moiety which contains a double bond, including a double bond at one terminus. Other suitable linkers include, for example, substituted alkynes or alkenynes, carbonyl moieties, and the like.
